

CIS 6930/4930 Computer and Network Security

Midterm review

About the Test

- This is an open book and open note exam.
 - You are allowed to read your textbook and notes during the exam;
 - However, you are not allowed to exchange anything with or talk to each other unless you get permission from the instructor.
 - You may bring your laptop to the exam **but you are not allowed to access to internet during the exam.**

Covered Topics

- Lectures 1 - 9
 - Basic Security Concepts
 - Introduction to Cryptography
 - DES
 - Modes of Block Cipher Operations
 - Double DES and Triple DES
 - Number Theory
 - Public Key Cryptography

Type of Questions

- Multiple choices (25%)
- Simple calculation (25%)
- Open-ended questions (50%)

Introduction to Cryptography

- Basic Security Concepts
 - Confidentiality, integrity, availability
- Introduction to Cryptography
 - Secret key cryptography
 - Sender and receiver share the same key
 - Applications
 - Communication over insecure channel, Secure storage, Authentication, Integrity check

Introduction to Cryptography

- Introduction to Cryptography
 - Public key cryptography
 - Public key: publicly known
 - Private key: kept secret by owner
 - Encryption/decryption mode
 - How the keys are used?
 - Digital signature mode
 - How the keys are used?
 - Application: Secure communication, secure storage, authentication, digital signature, key exchange

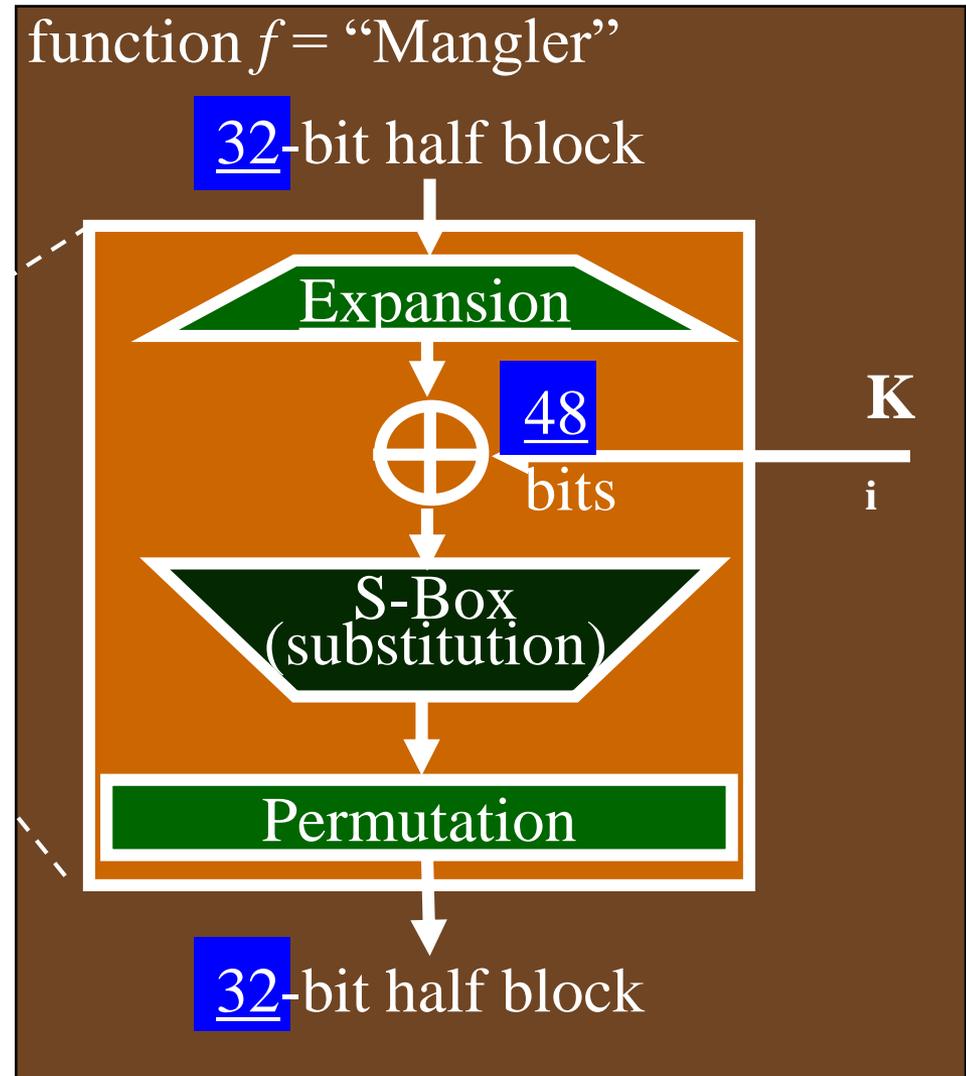

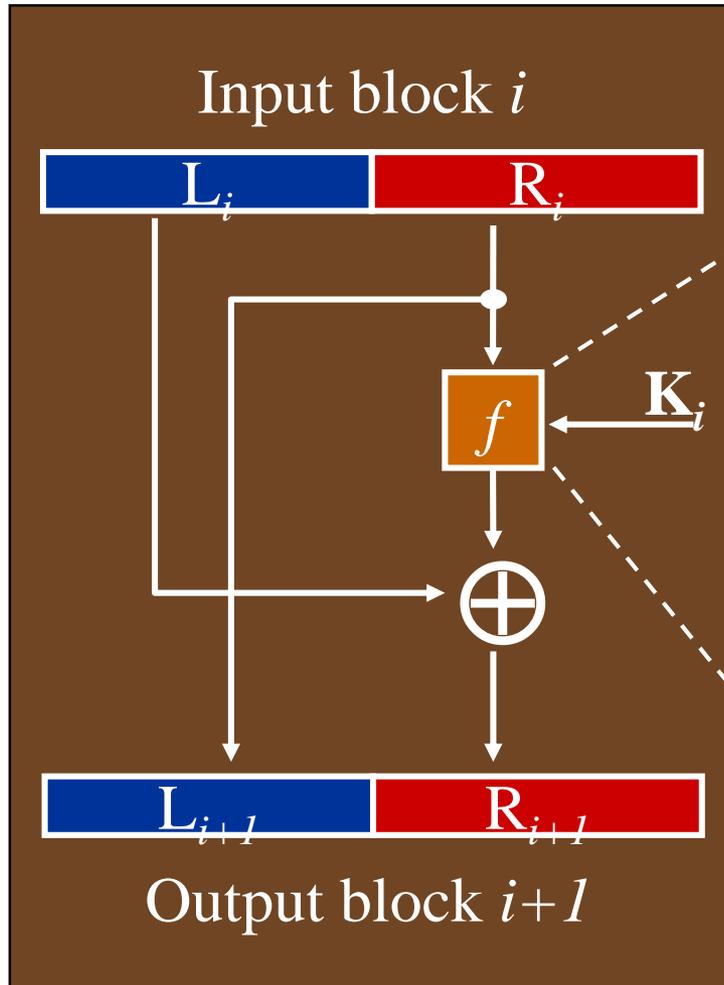

Introduction to Cryptography

- Introduction to Cryptography
 - Hash function
 - Map a message of arbitrary length to a fixed-length short message
 - Desirable properties
 - Performance, one-way, weak collision free, strong collision free

DES

- DES
 - Parameters
 - Block size (input/output 64 bits)
 - key size (56 bits)
 - number of rounds (16 rounds)
 - subkey generalization algorithm
 - round function

DES Round: f (Mangler) Function

Modes of Block Cipher Operations

- ECB (Electronic Code Book)
- CBC (Cipher Block Chaining Mode)
- OFB (Output Feedback Mode)
- CFB (Cipher Feedback Mode)

Modes of Block Cipher Operations

- Properties of Each Mode
 - Chaining dependencies
 - Error propagation
 - Error recovery

Double DES and Triple DES

- You need to understand how double and triple DES works
 - Double DES $C = E_{k2}(E_{k1}(P))$
 - Triple DES $C = E_{k1}(D_{k2}(E_{k1}(P)))$
 - Meet-in-the-middle attacks
 - Operation modes using Triple DES

Number Theory Summary

- Fermat: If p is prime and a is positive integer not divisible by p , then $a^{p-1} \equiv 1 \pmod{p}$

Example: 11 is prime, 3 not divisible by 11, so $3^{11-1} = 59049 \equiv 1 \pmod{11}$

Euler: For every a and n that are relatively prime, then $a^{\phi(n)} \equiv 1 \pmod{n}$

Example: For $a = 3$, $n = 10$, which relatively prime: $\phi(10) = 4$, $3^{\phi(10)} = 3^4 = 81 \equiv 1 \pmod{10}$

Variant: for all a in \mathcal{Z}_n^* , and all non-negative k , $a^{k\phi(n)+1} \equiv a \pmod{n}$

Example: for $n = 20$, $a = 7$, $\phi(n) = 8$, and $k = 3$: $7^{3 \cdot 8 + 1} \equiv 7 \pmod{20}$

Generalized Euler's Theorem: for $n = pq$ (p and q are distinct primes), all a in \mathcal{Z}_n , and all non-negative k , $a^{k\phi(n)+1} \equiv a \pmod{n}$

Example: for $n = 15$, $a = 6$, $\phi(n) = 8$, and $k = 3$: $6^{3 \cdot 8 + 1} \equiv 6 \pmod{15}$

$x^y \pmod{n} = x^{y \pmod{\phi(n)}} \pmod{n}$ (foundation for RSA public key cryptographic)

Example: $x = 5$, $y = 7$, $n = 6$, $\phi(6) = 2$, $5^7 \pmod{6} = 5^{7 \pmod{2}} \pmod{6} = 5 \pmod{6}$

Multiplicative Inverses

- Don't always exist!
 - Ex.: there is no z such that $6 \times z = 1 \pmod{8}$ ($m=6$ and $n=8$)

z	0	1	2	3	4	5	6	7	...
$6 \times z$	0	6	12	18	24	30	36	42	...
$6 \times z \pmod{8}$	0	6	4	2	0	6	4	2	...

- An positive integer $m \in \mathbb{Z}_n$ has a multiplicative inverse $m^{-1} \pmod{n}$ iff $\gcd(m, n) = 1$, i.e., m and n are relatively prime
 - \Rightarrow If n is a prime number, then all positive elements in \mathbb{Z}_n have multiplicative inverses

Finding the Multiplicative Inverse

- Given m and n , how do you find $m^{-1} \bmod n$?
- Extended Euclid's Algorithm
exteuclid(m, n):
 $m^{-1} \bmod n = v_{n-1}$
- if $\gcd(m, n) \neq 1$ there is **no** multiplicative inverse $m^{-1} \bmod n$

Example

x	q_x	r_x	u_x	v_x
0	-	35	1	0
1	-	12	0	1
2	2	11	1	-2
3	1	1	-1	3
4	11	0	12	-35

$$\gcd(35, 12) = 1 = -1 \cdot 35 + 3 \cdot 12$$

$$12^{-1} \bmod 35 = \mathbf{3} \text{ (i.e., } 12 \cdot 3 \bmod 35 = 1)$$

Discrete Logarithms

- For a primitive root a of a number p , where $a^i \bmod p = b$, for some $0 \leq i \leq p-1$
 - the exponent i is referred to as the *discrete logarithm of b to the base a , mod p*
 - Given a , i , and p , computing $b = a^i \bmod p$ is straightforward
 - Given a , p , and b , computing the discrete logarithm i is hard. The common method is the brute force method.

i	1	2	3	4	5	6	7	8	9
$3^i \bmod 7$	3	2	6	4	5	1	3	2	6

Public Key Cryptography

- RSA Algorithm
 - Basis: factorization of large numbers is hard
 - Variable key length (1024 bits or greater)
 - Variable plaintext block size
 - plaintext block size must be smaller than key size
 - ciphertext block size is same as key size

Generating a Public/Private Key Pair

- Find large primes p and q
- Let $n = p * q$
 - do not disclose p and q !
 - $\phi(n) = (p-1)*(q-1)$
- Choose an e that is relatively prime to $\phi(n)$
 - **public** key = $\langle e, n \rangle$
- Find $d =$ multiplicative inverse of $e \bmod \phi(n)$ (i.e., $e * d = 1 \bmod \phi(n)$)
 - **private** key = $\langle d, n \rangle$

RSA Operations

- For plaintext message m and ciphertext c

Encryption: $c = m^e \bmod n, m < n$

Decryption: $m = c^d \bmod n$

Signing: $S = m^d \bmod n, m < n$

Verification: $m = s^e \bmod n$
